

Supported Functions

This is a list of TeX functions supported by KaTeX. It is sorted into logical groups.

There is a similar Support Table, sorted alphabetically, that lists both supported and un-supported functions.

Accents

a^\prime a'	$ ilde{a}$ \tilde{a}	\mathring{g} \mathring{g}
$a^{\prime\prime}$ a''	\widetilde{ac} \widetilde{ac}	\widehat{AB} \overgroup{AB}

Search 0.11.1 Users GitHub

Acceptable line separators include: \\ , \cr , \\[distance] , and \cr[distance] . Distance can be written with any of the KaTeX units.

The {array} environment supports | and : vertical separators.

Docs

The {array} environment does not yet support \cline or \multicolumn .

HTML

Try

The following "raw HTML" features are potentially dangerous for untrusted inputs, so they are disabled by default, and attempting to use them produces the command names in red (which you can configure via the errorColor option). To fully trust your LaTeX input, you need to pass an option of trust: true; you can also enable just some of the commands or for just some URLs via the trust option.

$K^{A}T_{E}X$	\href{https://katex.org/}{\KaTeX}
https://katex.org/	\url{https://katex.org/}
•	<pre>\includegraphics[height=0.8em, totalheight=0.9em, width=0.9em, alt=KA logo]{https://katex.org/img/khan- academy.png}</pre>

\includegraphics supports height, width, totalheight, and alt in its first argument. height is required.

Script	A-Z	Sans serif italic	A-Z a-z
Fractur	A-3 a-3	Monospace	A-Z a-z 0-9

Unicode

The letters listed above will render properly in any KaTeX rendering mode.

In addition, Brahmic, Georgian, Chinese, Japanese, and Korean glyphs are always accepted in text mode. However, these glyphs will be rendered from system fonts (not KaTeX-supplied fonts) so their typography may clash. You can provide rules for CSS classes .latin-fallback , .cyrillic-fallback , .brahmic-fallback , .georgian-fallback , .cjk-fallback , and .hangul-fallback to provide fallback fonts for these languages. Use of these glyphs may cause small vertical alignment issues: KaTeX has detailed metrics for listed symbols and most Latin, Greek, and Cyrillic letters, but other accepted glyphs are treated as if they are each as tall as the letter M in the current KaTeX font.

If the KaTeX rendering mode is set to strict: false or strict: "warn" (default), then KaTeX will accept all Unicode letters in both text and math mode. All unrecognized characters will be treated as if they appeared in text mode, and are subject to the same issues of using system fonts and possibly using incorrect vertical alignment.

For Persian composite characters, a user-supplied plug-in is under development.

Layout

Annotation

∯ \cancel{5}	$\overbrace{a+b+c}^{\rm note} \\ \ \ \ \ \ \ \ \ \ \ \ \ \$

$$\text{tag}\{\text{hi}\}\ x+y^{2x}\}$$

$$x + y^{2x} \tag{hi}$$

$$\text{tag}^{hi} x+y^{2x}$$

$$x + y^{2x}$$
 hi

Line Breaks

KaTeX 0.10.0+ will insert automatic line breaks in inline math after relations or binary operators such as "=" or "+". These can be suppressed by \nobreak or by placing math inside a pair of braces, as in $\{F=ma\}$. \allowbreak will allow automatic line breaks at locations other than relations or operators.

Hard line breaks are \\ and \newline .

In display math, KaTeX does not insert automatic line breaks. It ignores display math hard line breaks when rendering option strict: true.

Vertical Layout

x_n x_n	! \stackrel{!}{=}	$rac{a}{b}$ a \atop b
e^x e^x	! \overset{!}{=}	$a^{ m b}c$ a\raisebox{0.25em}{b}c
o u _u^o	<pre>= \underset{!}{=} !</pre>	$\sum_{\substack{0 < i < m \\ 0 < j < n}}$ \sum_{\substack{0 < i < m \\0 < j < n}}

The second argument of \raisebox can contain math if it is nested within \$...\$ delimiters, as in \raisebox{0.25em}{\$\frac a b\$}

Try Docs Users GitHub
$$au$$
 \mathrm{\gamma} \psi \gamma \

$$\sum_{1 \leq i \leq j \leq n} x_{ij} \ \, \text{`mathclap{1}le i} \ \, \text{i} \ \, \text{n}} \ \, \text{x_{ij}}$$

KaTeX also supports \label{lap} , \label{lap} , and \label{lap} , but they will take only text, not math, as arguments.

Spacing

Function	Produces	Function	Produces
	³ / ₁₈ em space	\kern{distance}	space, width = <i>distance</i>
\thinspace	³ / ₁₈ em space	\mkern{distance}	space, width = <i>distance</i>

Docs

Extensible arrows all can take an optional argument in the same manner as \xrightarrow[under]{over}.

Style, Color, Size, and Font

Class Assignment

```
\mathbin \mathclose \mathinner \mathop
\mathopen \mathord \mathpunct \mathrel
```

Color

$$F=ma$$
 \colon{blue} F=ma

Note that KaTeX \color acts like a switch. This aligns with LaTeX and differs from MathJax. Other KaTeX color functions expect the content to be a function argument:

```
F=ma \textcolor{blue}{F=ma} F=ma \text{ \textcolor}{\#228B22}{F=ma}  A \colorbox{aqua}{A} \fcolorbox{red}{aqua}{A}
```

For color definition, KaTeX color functions will accept the standard HTML predefined color names. They will also accept an RGB argument in CSS hexadecimal style. The "#" is optional before a six-digit specification.

Font

Try	Docs	Users	GitHub
((0	,	
${ m Ab0}$ \rm Ab0	${f Ab0}$ \bold{Ab0}	$Ab0 \ \text{textup{Ab0}}$	
Ab0 Ab0	$m{Ab0}$ \boldsymbol{Ab}	AB \Bbb{AB}	
$Ab0 \setminus \text{text}\{Ab0\}$	$m{Ab0}$ \bm{Ab0}	\mathbb{AB} \mathbb{AB}	
$Ab0 \ \text{mathsf}\{Ab0\}$	$Ab0\ \text{textmd{Ab0}}$	Abo \frak{Ab0}	
Ab0 \textsf{Ab0}	AbO \mathtt{Ab0}	2160 \mathfrak{Ab0}	
Ab0 \sf Ab0	AbO \texttt{Ab0}	\mathcal{AB}_{0} \mathcal{AB0}	
	AbO \tt Ab0	$\mathscr{A}\mathscr{B}$ \mathscr{AB}	

One can stack font family, font weight, and font shape by using the textXX versions of the font functions. So $\text{textsf}\{\text{H}\}\$ will produce \mathbf{H} . The other versions do not stack, e.g., $\text{mathsf}\{\text{mathbf}\{H\}\}\$ will produce \mathbf{H} .

In cases where KaTeX fonts do not have a bold glyph, $\protect\protec$

Size

AB \Huge AB	AB \normalsize AB
AB \huge AB	AB \small AB
AB \large ab	AB \footnotesize AB
AB \Large AB	AB \scriptsize AB
AB \large AB	AB \tiny AB

Style

Try Docs Users GitHub x \scriptstyle x (The size of a first sub/superscript) $\begin{array}{c} x \text{ } & \text{ } \\ x \text{ }$

\text{...} will accept nested \$...\$ fragments and render them in math mode.

KaTeX Unit	Value	KaTeX Unit	Value
em	CSS em	bp	1/72 inch × F × G
ex	CSS ex	рс	12 KaTeX pt
mu	1/18 CSS em	dd	1238/1157 KaTeX pt
pt	1/72.27 inch × F × G	СС	14856/1157 KaTeX pt
mm	1 mm × F × G	nd	685/642 KaTeX pt
cm	1 cm × F × G	nc	1370/107 KaTeX pt
in	1 inch × F × G	sp	1/65536 KaTeX pt

where:

F = (font size of surrounding HTML text)/(10 pt)

G = 1.21 by default, because KaTeX font-size is normally 1.21 \times the surrounding font size. This value can be overridden by the CSS of an HTML page.

The effect of style and size:

Unit	textstyle	scriptscript	huge
em or ex
